

Password Management for Business

Mishimoto Case Study

Introduction

Mishimoto Automotive, a leading manufacturer and retailer of high-quality, aftermarket performance-cooling products participate in a number of online portals that require staff to manage and share a multitude of business passwords. As a manufacturer, protecting the company's intellectual property is also a vital component of corporate security. Chief Executive, Mike Sullivan explains how My1Login easily solved both problems.

Customer: Mishimoto
Sector: Manufacturing
Country: United States of America

The Challenge

On Average Each
Employee Saves

1 hr
PER WEEK

"We participate on a number of social outlets and forums and were challenged with providing multiple members of staff with secure access to these accounts. Legacy internal systems were in place to manage passwords but they struggled to meet the changing needs of our business."

Mishimoto was established in 2003 with the goal of providing customers with superior cooling system upgrades suited for track cars and daily drivers alike. The staff of automotive enthusiasts work hard to consistently produce the highest-quality products and provide exceptional customer service. As a manufacturer, it's also vital to secure the company's intellectual property and maintain a competitive edge.

The Solution

Mike continues "My1Login solved our password management problems by enabling us to easily and securely share password access to specific systems across our team. My1Login centralised the visibility of all passwords in use across Mishimoto and has made it is easier to rollout password changes for shared systems. It has also enabled us to use much stronger passwords throughout the business since we don't have to remember them anymore"

“My1Login has helped improve our online security, & reduce the effort involved in managing passwords”

Working in conjunction with existing business passwords (so no need to change them), My1Login is a cloud-based password manager that enables business users to securely manage and, where authorised, share specific passwords for business applications using one login. Management and Administrators benefit from a company wide audit trail of all business passwords and who's using them.

A business end-user's key phrase encrypts access to their business passwords using client-side AES 256. That means even if someone maliciously accessed My1Login's servers, it would still be impossible for anyone to decrypt and access that stored password data without the key phrase. It would take the most advanced computers millions of years to try out every possible permutation of a reasonable length phrase.

The Benefits

"My1Login has been of significant help in improving our online security, and reducing the effort involved in managing passwords and shared access to systems. It also helps protect our intellectual property ensuring that we maintain a competitive edge when it comes to product quality."

Security dashboards provide Mishimoto Automotive with reports on the strength of passwords that protect their business accounts.

"Using My1login has been of significant help in improving Mishimoto's security and has enabled us to use much stronger passwords across the board. The workgroups feature on My1Login has been the most useful feature for us because it makes it easier to quickly share specific logins with different departments and teams."
